	Master Finance	
	University of Amsterdam	Sept 2014 - Mar 2017
	Bachelor Economics and Business	

Job Market Paper	Working Under Distractions
	<i>Abstract:</i> Distractions are common in the modern workplace with its noisy open-plan offices and constant digital interruptions. I use an incentivized laboratory experiment to study the effects of auditory and task-switching distractions on two important worker outcomes: performance and mental well-being. I also elicit individual's willingness to pay to avoid distractions. Further, I elicit people's attitudes towards working under distractions both in the lab and in a representative Dutch survey panel. I obtain three main results. First, I find that while working under distractions does not have a strong impact on performance in the lab, both types of distraction are detrimental to individuals' self-reported mental well-being. Second, the heterogeneity in the impact on mental well-being can be partially captured by simple survey questions on attitudes towards working under distractions. These attitude questions are also strongly correlated with income and job satisfaction in the survey data. Lastly, I find that individuals are willing to pay a positive amount to avoid working under distractions on average and this willingness to pay is negatively correlated with the change in mental well-being, but not in performance while working under distractions.
